

### Sales per Transaction

| Metric                                                             | Value     |
|--------------------------------------------------------------------|-----------|
| Mean (Average revenue per transaction item)                        | 384.14527 |
| Median (Typical customer spending per item)                        | 289.75    |
| Mode (Most common transaction value)                               | 228       |
| Variance (How much sales values fluctuate)                         | 114485.77 |
| Std Deviation                                                      | 338.35745 |
| Skewness (Whether business depends on few high-value transactions) | 3.171222  |
| Kurtosis (Whether there are extreme spikes (big purchases))        | 13.227441 |

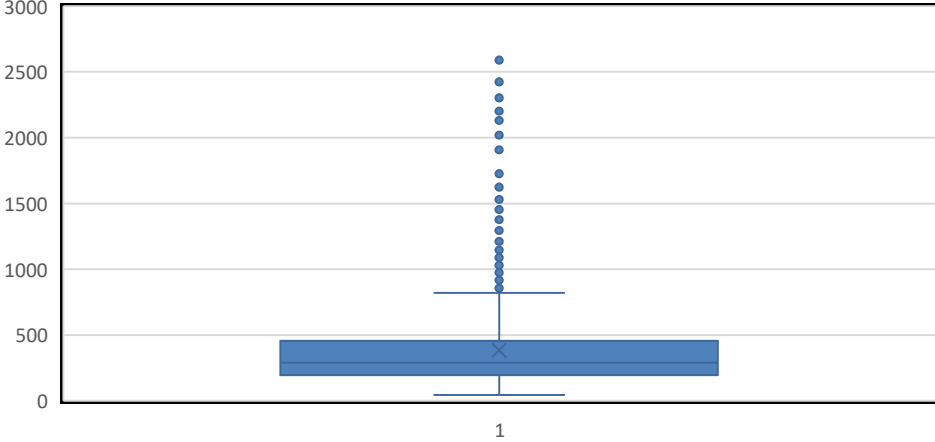

### Sales Distribution (Final Amount per Transaction)

### Mean vs Median Sales Comparison

### Sales Distribution and Outliers (Final Amount)

#### Business Insights-

- Sales data is **highly right-skewed (Skewness = 3.17)**, indicating that most transactions are of low to medium value, while a few high-value transactions significantly increase overall revenue.
- The **mean (₹384) is higher than the median (₹289)**, confirming that average sales are influenced by a small number of large purchases.
- The **standard deviation (₹338)** is relatively high, showing that sales values are highly variable and business performance is not consistent.
- The **high kurtosis value (13.22)** indicates the presence of extreme outliers, meaning occasional large transactions or bulk purchases.
- The most frequent transaction value (**Mode = ₹228**) suggests that typical customer purchases fall in the lower price range.
